FREE MARKET PREP GUIDE

SOOTYEDGE

STRUCTURE. PRECISION. EDGE.

THE 10-MINUTE
OPTIONS & FUTURES MARKET PREP CHECKLIST

A repeatable TradingView routine for deciding what to review before you risk capital.

Designed as a concise framework. Your actual preparation time will vary by market, experience, and workflow.

START HERE

Why chart preparation becomes harder than it should

Most traders do not suffer from a lack of information. They suffer from reviewing information in a different order every session.

THREE COMMON BREAKDOWNS

01

Tool hopping

Adding indicators or changing methods before the current process has been used consistently.

02

Timeframe conflict

Reacting to a lower-timeframe move without checking the larger market context.

03

Undefined decisions

Considering execution before invalidation, risk limits, or a legitimate reason to wait.

WHAT THIS GUIDE DOES

- ☐ Organizes what to review first, second, third, and last.
- ☐ Creates bullish, bearish, and wait scenarios.
- ☐ Keeps invalidation and risk inside preparation.
- ☐ Works manually with your existing chart method.

WHAT IT DOES NOT DO

- ☐ Predict market direction or select an Options contract.
- ☐ Place or automate trades.
- ☐ Replace risk management, data, or education.
- ☐ Guarantee speed, confidence, consistency, or profit.

Core rule: Your final preparation conclusion does not have to be bullish or bearish. Wait / no trade is a complete and valid conclusion.

Educational only. Not investment advice. Options and Futures trading involves substantial risk, including loss of capital.

ONE SEQUENCE

The four-question framework

Answer each question in order. Every question narrows the next decision.

1 What is the trend?

Review higher-timeframe and chart-timeframe context. Record aligned, conflicted, or unclear.

Output: directional context or a reason to stand aside.

2 Who has control?

Identify the latest meaningful shift. Did it confirm, fail, or remain unresolved?

Output: buyer control, seller control, or unresolved control.

3 Where are the decision areas?

Mark the nearest relevant areas above and below price using your existing method.

Output: places where your plan may require reevaluation.

4 What are the planning levels?

Define reference, invalidation, objectives, and maximum risk required by your strategy.

Output: a conditional plan - not a command to trade.

Preparation rule: Do not skip ahead. A planning level without context can look precise while remaining disconnected from the larger market picture.

Educational only. Not investment advice. Options and Futures trading involves substantial risk, including loss of capital.

CONTEXT BEFORE EXECUTION

Trend and control

1 WHAT IS THE TREND?

- ☐ Market, instrument, session, and chart timeframe are selected.
- ☐ Higher-timeframe direction has been reviewed.
- ☐ Chart-timeframe direction has been reviewed.
- ☐ Alignment, conflict, or uncertainty is written down.
- ☐ The condition that invalidates the current context is understood.

Current context:

_____

_____

2 WHO HAS CONTROL?

- ☐ The most recent meaningful control shift is identified.
- ☐ The shift is confirmed, failed, or still unresolved.
- ☐ Any retest or hold required by your method is reviewed.
- ☐ A single candle is not treated as the complete thesis.
- ☐ Conflicting evidence is treated as a reason to wait.

Control evidence:

_____

_____

STOP RULE

If trend and control are materially conflicted and your strategy has no rule for that condition, stop the preparation process and record wait.

Educational only. Not investment advice. Options and Futures trading involves substantial risk, including loss of capital.

MAP BEFORE ACTION

Decision areas and planning levels

3. WHERE ARE THE DECISION AREAS?

- ☐ Mark the nearest relevant area above price.
- ☐ Mark the nearest relevant area below price.
- ☐ Note whether price is approaching, inside, or leaving either area.
- ☐ Confirm there is enough visible room for your strategy.
- ☐ Avoid turning every chart line into an important level.

4. WHAT ARE THE PLANNING LEVELS?

- ☐ Define the reference level required by your strategy.
- ☐ Define where the idea becomes invalid.
- ☐ Define potential objectives before considering execution.
- ☐ Confirm your maximum permitted risk.
- ☐ Confirm that waiting remains an acceptable result.

WRITE THREE CONDITIONAL SCENARIOS

Scenario	What must be true?	Where does the idea fail?
Bullish		
Bearish		
Wait		

SootyEdge and this checklist do not decide whether you should trade. Every decision, position size, execution, and risk remains yours.

A CONCISE ORDER

The 10-minute preparation routine

The timing is a planning guide, not a guaranteed completion time.

0:00-1:00

Set the chart

Choose market, instrument, session, timeframe, and the maximum risk allowed by your plan.

1:00-3:00

Review trend

Compare higher-timeframe and chart-timeframe context. Write aligned, conflicted, or unclear.

3:00-5:00

Review control

Identify the latest meaningful shift. Record confirmed, failed, or unresolved.

5:00-7:00

Mark decision areas

Mark only the closest relevant areas above and below price using your existing method.

7:00-9:00

Define planning levels

Write the reference, invalidation, potential objectives, and maximum risk required by your strategy.

9:00-10:00

Make the preparation decision

Record one conclusion: bullish scenario, bearish scenario, or wait.

MINIMUM VIABLE PREPARATION RULE

If one of the four questions cannot be answered with your method, do not manufacture certainty. Record the missing answer and wait until your process provides it.

Educational only. Not investment advice. Options and Futures trading involves substantial risk, including loss of capital.

ONE FRAMEWORK, DIFFERENT FINAL STEPS

Adapt the checklist to your market

OPTIONS WORKFLOW

Use the checklist on the underlying chart, such as SPY or QQQ, to organize market context and reference areas.

KEEP THESE TASKS SEPARATE

- ☐ Contract, strike, and expiration selection
- ☐ Greeks and implied volatility
- ☐ Bid/ask spread and liquidity
- ☐ Position sizing and execution

The checklist and SootyEdge do not perform Options-chain decisions.

FUTURES WORKFLOW

Use the checklist directly on a supported Futures chart, such as ES or NQ.

KEEP THESE TASKS SEPARATE

- ☐ Contract and rollover selection
- ☐ Session, broker, and market-data requirements
- ☐ Order-flow or execution-platform decisions
- ☐ Position sizing and order entry

The checklist and SootyEdge do not replace execution infrastructure.

AFTER-SESSION PROCESS REVIEW

1. Did I follow the same preparation order?
2. Which question was hardest to answer?
3. Did I act outside the written scenario?
4. Did I respect the risk limit and invalidation?
5. What process adjustment, if any, should be tested next session?

Review the process, not only the financial outcome. One winning or losing trade does not establish whether a process is reliable.

USE BEFORE EVERY SESSION

Your final preparation page

SESSION SETUP

Instrument: _____ **Session:** _____

Chart timeframe: _____ **Higher timeframe:** _____

Market: _____ **Maximum risk:** _____

THE FOUR QUESTIONS

- ☐ Trend: aligned, conflicted, or unclear?
- ☐ Control: buyers, sellers, or unresolved?
- ☐ Decision Areas: nearest relevant areas above and below?
- ☐ Planning Levels: reference, invalidation, objectives, and risk defined?

WRITTEN CONCLUSION

- ☐ Bullish scenario documented
- ☐ Bearish scenario documented
- ☐ Wait / no-trade condition documented

FINAL CHECK

- ☐ I am not treating this checklist as a signal or recommendation.
- ☐ I understand that no setup or outcome is guaranteed.
- ☐ I remain responsible for the decision, position size, execution, and risk.

NEXT STEP

Want to see the complete four-stage workflow inside TradingView?

SootyEdge organizes Trend -> Control -> Decision Areas -> Planning Levels across three invite-only indicators.

$2,500 once. Lifetime personal software usage. No recurring software subscription.
